

1. Raw data

2. Seaborn Interpretation

3. Identification of outliers and data noise cleaning

4. Data aggregating by incorporating Moving average (SMV, step = 22 days)

(after some experiments this value of step aggregate historical values avoiding overfitting and keep representative)

5. Generating Linear Linear Regression equation

$$y = 194482.23 + 29.53 \times X$$

Pearson correlation coefficient: 0.874

$$y = 186146.99 + 39.94 \times X$$

Pearson correlation coefficient: 0.964
